

Codex / GitHub Migration Payload

Application 9.1.1 - Repository Bootstrap, Governance, Contracts, Module Revisioning, and Commenting Policy

Purpose

This payload is designed to be uploaded to Codex or pushed into GitHub as the new source-of-truth repository. It contains the v9.1.0 gameplay baseline plus repository governance, frozen API contracts, module manifests, validation scripts, GitHub workflows, Codex prompts, and a mandatory commenting policy.

Bootstrap validation result

Check	Result
Rule checks	32 passed
API checks	9 passed, 0 failed
Contract validation	12 OpenAPI files passed
Module boundary validation	passed
Requirements registry	344 requirements passed
Module versions	19 modules passed
Comment density	3133/3133 meaningful Python/JavaScript lines commented (100.0%)
JavaScript syntax	passed for web/app.js, admin.js, core modules, and games

Repository operating model

GitHub/Codex control flow

Codex reads the root and module-specific AGENTS.md files, works from module-scoped issues, opens pull requests, and must satisfy contracts, requirements, tests, version bumps, and documentation before merge.

Module isolation and versioning

Module	Version
admin	1.1.0
application	9.1.1
audio	9.1.0
autoplay	1.1.0
baccarat	9.0.1
bingo	9.0.1
blackjack	9.0.1
bots	1.0.0
commenting_policy	1.0.0
contracts	1.0.0
core	9.1.0

docs	1.1.1
keno	9.0.1
ledger	9.0.1
players	9.0.1
roulette	9.1.0
slots	9.0.1
tests	1.1.1
tooling	1.0.0

API contract freeze

Contract-governed API changes

/api/v1 is frozen. Additive compatible changes can remain in v1. Breaking changes require /api/v2 or a compatibility shim. Any API change must align affected contracts, frontend/API consumers, tests, requirements, docs, and module versions.

Mandatory commenting policy

Every meaningful executable Python and JavaScript line must have an inline or immediately adjacent purpose comment. HTML, CSS, YAML/OpenAPI, Markdown, and JSON use section-level or adjacent documentation where line comments are not syntactically appropriate. The payload includes scripts/check_comment_density.py and the current codebase passes at 100.0 percent for meaningful Python/JavaScript lines.

Key files in the payload

Path	Purpose
CODEX_START_HERE.md	First file Codex should read.
FIRST_PROMPT_FOR_CODEX.md	Copy/paste first Codex task prompt.
AGENTS.md	Repository-wide Codex rules.
modules/*.json	Independent module revision manifests.
contracts/openapi/*.v1.yaml	Frozen public API contract skeletons.
scripts/bootstrap_repo.py	Runs core validation checks.

scripts/validate_module_boundaries.py	Prevents cross-game coupling.
scripts/check_comment_density.py	Enforces commenting policy.
.github/workflows/*.yaml	GitHub Actions scaffolding.
codex/prompts/*.md	Module-specific Codex prompts.

First GitHub steps

1. Create GitHub repository: virtual-casino-simulator
2. Unzip this payload and push the contents to main.
3. Enable branch protection and required status checks.
4. Connect Codex to the GitHub repository.
5. Start Codex with FIRST_PROMPT_FOR_CODEX.md.
6. Going forward, create one issue and one Codex conversation per module task.

Acceptance policy

A pull request is acceptable only when impacted requirement IDs are listed, module versions are bumped, API contracts and compatibility manifests are aligned, tests pass, docs are regenerated, and no module-boundary rules are violated.
